

Enable / Disable IPv6 on macOS

Open Network Preferences through: Applications > System Preferences > Network

Disabling IPv6 on macOS

To disable IPv6 on your machine with the following commands in Terminal (Accessible through /Applications/Terminal.app)

To Get List of Hardware

```
networksetup -listallnetworkservices
```

This is to double check the interface names recognized by the operating system matches those in Network Preferences.

To Disable IPv6 on Desired Interface

```
sudo networksetup -setv6off "Interface_Name"
```

Note: Change "Interface_Name" to the name of the desired interface you wish to disable. (**NOT** case sensitive)

Enabling IPv6 on macOS

Enable IPv6 on your machine with the following commands in Terminal (Accessible through /Applications/Terminal.app)

To Enable IPv6 on Desired Interface

```
sudo networksetup -setv6automatic "Interface_Name"
```

Note: Change "Interface_Name" to the name of the desired interface you wish to enable. (**NOT** case sensitive)

This has been tested to work on v10.12 and v10.13
